

If Your Organization Is:

Experiencing an integration crisis

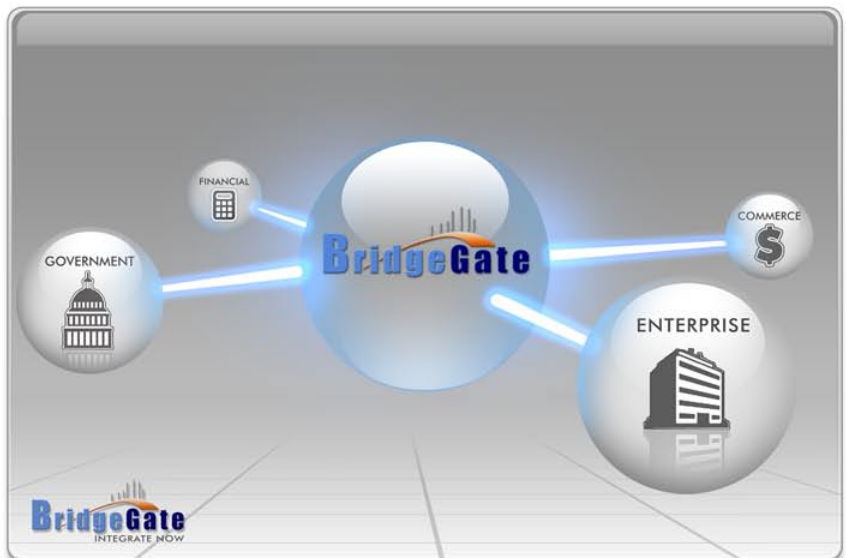

Facing impossible expectations

Bogged down in programming requirements

Lacking business and IT agility in the marketplace

Searching for a faster and simpler integration platform

Seeking "enabling" technology

BridgeGate™ is a comprehensive unified integration platform that makes integration tasks simpler, faster, more accurate and auditable.

BridgeGate™ is fundamentally different from other integration architectures in how it treats and handles data. By taking input in a native data format and immediately transforming it to the outbound native data format, BridgeGate achieves unparalleled simplicity, speed, scalability, and capability that no other product can achieve.

BridgeGate™ also provides business capabilities, such as BAM, BPM, BI that compliment the already robust capabilities of B2Bi, EDI, ETL, Web Integration, ESB, Order Buss, SOA and superior integration, translation and transformation capabilities. These advanced easy to use and understand features/capabilities allow the user to develop additional organizational capabilities without the need for additional "tool kits," extensive programming, changes to hardware systems, or additional staff.

BridgeGate™ is an outstanding integration platform in solving data, event and service oriented integration, using the same graphical user interface (GUI). The BridgeGate GUI simplifies the integration process, requires no programming and enables a user to quickly accomplish integration tasks reliably.

BridgeGate™ is a comprehensive unified integration platform. It is the only integration platform that translates and transforms data in real-time from one native format to another without the need for programming, additional tool kits, queuing or data federation.

BridgeGate™ users define and test all inbound and outbound data, rules and workflow on their desktop prior to deploying the solution on production hardware. Immediate benefits to the organization include more effective resource utilization, dramatic reduction in developing a deployable solution and improvement in the likelihood of a successful integration, the first time.

BridgeGate™ is designed in a layered and modular manner. This design facilitates the minimization and in most cases the elimination of programming required for integration, while simultaneously retaining outstanding customization features. No other integration platform allows for customization of security, compression, scheduling, work flow, portals or any proprietary plug-in with little or no programming. This capability increases the flexibility and ability of organizations to retain their IT autonomy, ability to create advance processes and maintain developed processes with a minimum of staff.
